

AMENDMENTS TO CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A stator winding structure of a motor or a generator comprising separated different-shaped rod conductors, said different-shaped rod conductors being combined together to form a collective winding structure to take the place of the conventional coil wire, said stator winding structure comprising a silicon-steel sheet stator, a plurality of different-shaped rod conductors, front conductors and rear conductors, said silicon-steel sheet stator bored with plural coil slots, said different-shaped rod conductors insulated mutually to be inserted in said coil slots of said stator, said front and said rear conductors and said different-shaped rod conductors connected together to form a-said collective winding structure according to a sequence designed, the contact surfaces of said rod conductors with said front and said rear conductors and the connecting surfaces of said rod conductors with an input terminal ~~of~~ for electric power being ~~conductive~~ conductive, the other surfaces of said conductors of said stator being insulated for avoiding a short circuit and preventing conductors from being bent during their winding process, said stator structure able to increase a slot occupied rate of said conductors and to reduce copper loss during output of large current,

wherein each said front conductor and each said rear conductor are respectively bored with two position holes, and each said different-shaped rod conductor has its opposite ends respectively provided with a position pin to be inserted in said position hole of said front and said rear conductor, said position pin being inserted in said position hole in sequence and connected by soldering, and

wherein said position pin at the opposite ends of said different-shaped rod conductor is formed with male threads onto which a nut is screwed after said position pin is inserted through said position hole of said front and said rear conductor.

2. (Original) The stator winding structure of a motor or a generator as claimed in Claim 1, wherein said stator winding structure is applicable to an outer stator of an inner rotor motor or generator.

3. (Original) The stator winding structure of a motor or a generator as claimed in Claim 1, wherein said stator winding structure is applicable to an inner stator of an outer rotor motor or generator.

4. (Canceled)

5. (Canceled)

6. (Canceled)

7. (Currently Amended) The stator winding structure of a motor or a generator as claimed in Claim ~~4~~ 1, wherein said different-shaped rod conductor has its opposite ends connected with said front and said rear conductor by bolts.

8. (Currently Amended) ~~The A~~ stator winding structure of a motor or a generator ~~as claimed in Claim 1 comprising separated different-shaped rod conductors, said different-shaped rod conductors being combined together to form a collective winding structure to take the place of the conventional coil wire, said stator winding structure comprising a silicon-steel sheet stator, a plurality of different-shaped rod conductors, front conductors and rear conductors, said silicon-steel sheet stator bored with plural coil slots, said different-shaped rod conductors insulated mutually to be inserted in said coil slots of said stator, said front and said rear conductors and said different-shaped rod conductors connected together to form said collective winding structure according to a sequence designed, the contact surfaces of said rod conductors with said front and said rear conductors and the connecting surfaces of said rod conductors with an input terminal for electric power being conductive, the other surfaces of said conductors of said stator being~~

insulated for avoiding a short circuit and preventing conductors from being bent during their winding process, said stator structure able to increase a slot occupied rate of said conductors and to reduce copper loss during output of large current, wherein said different-shaped rod conductor conductors and said front and said rear conductor-conductors are U-shaped-respectively.

9. (Currently Amended) ~~The A~~ stator winding structure of a motor or a generator as claimed in Claim 1 comprising separated different-shaped rod conductors, said different-shaped rod conductors being combined together to form a collective winding structure to take the place of the conventional coil wire, said stator winding structure comprising a silicon-steel sheet stator, a plurality of different-shaped rod conductors, front conductors and rear conductors, said silicon-steel sheet stator bored with plural coil slots, said different-shaped rod conductors insulated mutually to be inserted in said coil slots of said stator, said front and said rear conductors and said different-shaped rod conductors connected together to form said collective winding structure according to a sequence designed, the contact surfaces of said rod conductors with said front and said rear conductors and the connecting surfaces of said rod conductors with an input terminal for electric power being conductive, the other surfaces of said conductors of said stator being insulated for avoiding a short circuit and preventing conductors from being bent during their winding process, said stator structure able to increase a slot occupied rate of said conductors and to reduce copper loss during output of large current, wherein said different-shaped rod conductor conductors and said front and said rear conductor-conductors are L-shaped-respectively.
